Fishbone Diagram:

A Fishbone Diagram is used in Root Cause Analysis to find and organize the different causes of a problem.

It looks like a fish skeleton:

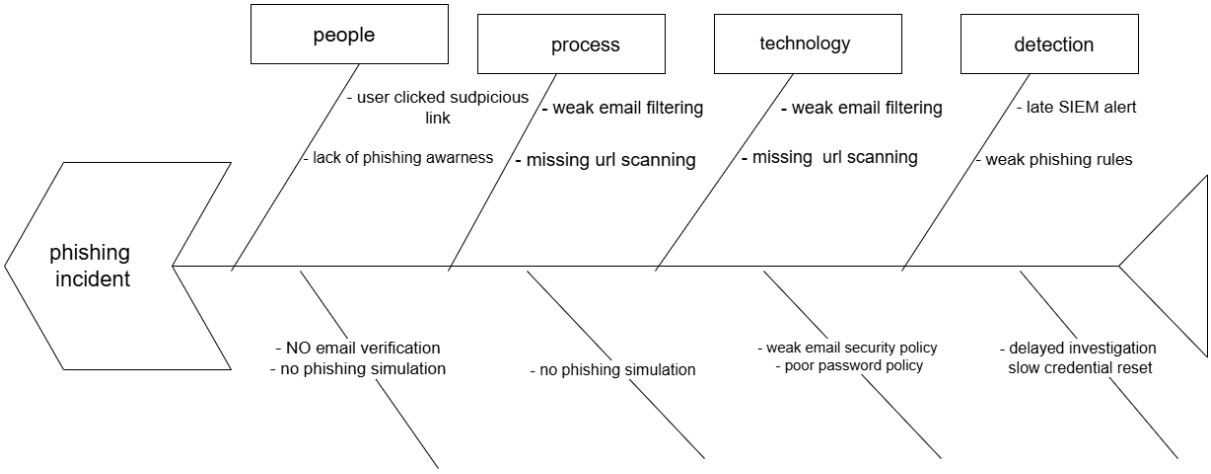
Head → the problem / incident

Bones → categories of causes

Small branches → specific reasons under each category

Creating a Fishbone Diagram:

Problem : Phishing Incident



This fishbone diagram explains the causes of a phishing incident. The main issue happened because of problems in people, process, technology, and detection. A user clicked a suspicious link due to lack of awareness. Security processes were weak, such as poor email filtering and no URL scanning or phishing simulation. Technology controls were also not strong, including weak email security and password policies. Detection was slow, with late alerts and delayed response actions like investigation and credential reset. Overall, the incident occurred due to a mix of human error, weak security setup, and slow detection and response systems.
